ABOUT US

Rasor Elettromeccanica Srl was born in Milan in 1946 by founder Mr. Luigi Spinelli with his inborn talent in technical and precision mechanics matters and exceptional ability successfully realized the first wholly hand-made bench cutter.

Rasor's products were firstly born for the application in textile industry while now the range has been enlarged to industries for technical textile and composite material production.

The distinctiveness of Rasor is the wholly inside work to start with design of the product, production, packaging, delivery. All thanks to workers professionally grown up together with the Company being in perfect agreement with the founder with the sole target to grant quality of each single produced cutter.

That is still the key point of Rasor and so to be daily engaged with any improvement and open to study and develop new materials and technologies.

Rasor boast an international network of distributors to be successfully present on all the Continents.

As of today Rasor Elettromeccanica Srl boast the professional continuity of two generation yet with the strong experience got by the founder thanks to his passion and devotion.

Textile products are all those material that at their raw state of semifinished product, finished, semipacked or packed are exclusively made from textile fibers regardless of mixing or joining process.

TEXTILE

In 1946 Rasor produce the first bench cutters for the cloth industry, leather industry and furniture industry.

For 60 years over 30000 units have been sold all over the world to textile laboratories and tannery.

The engagement of Rasor for the textile industry go forward with the introduction of cutters more and more versatile, light and step by step with the progress of technology and design.

A technic fabric is a fabric not produced for appearance purpose but for fabric feature itself. The application field of technic fabric is rapidly growing up also as support of a wide range of many other industrial fields.

TECHNICAL TEXTILE

The world growing rate of technic fabric production is about 4%/year compared with the growing of typical fabrics. The importance of development of technic fabric materials is on an equal footing with the industry's more and more requirements.

As of today the relatively most common technic fabric materials are applied in the following fields:

Agrotech, Mobiltech, Buildtech, Clothtech, Geotech, Hometech, Mobiltech, Oekotech, Packtech, Sporttech

In the latest years Rasor have developed technologies and experience to satisfy any requirement to cut technic fabrics with over 10 models within their range of electrical or pneumatic, hand-held or OEM cutting units.

The composite material is basically a material made of combination of more different simple materials. The ensemble of all the simple materials make a product able to guarantee very high mechanical properties with very low expansion of mass. This is why the composite material are widely used in application where key point is lightness.

COMPOSITE

The composite material are required in production fields where it is necessary to satisfy the need to keep light weight with high mechanical properties.

Particularly the aerospace, naval and automotive industries widely use composite material for the construction of wings structures, fuselages, trailers, boats, canoes, cars' panels, frames for Formula One cars, springs, engine parts and other accessories. The aerospace and warlike industries use composite material respectively for construction of components for space station and space vehicles and for construction of helmet and bullet-proof vest.

In the sport filed the composite material are applied for the construction of skies, bob-sleds, tennis rackets, bicycles, fishing rods, risers for archery and sticks for the high jump.

In medical field the composite material are applied for construction of prosthesis while in the plant construction composite material are used for pipes and tanks construction.

In the latest five years Rasor has focused their know-how and experience in the development of cutting tools especially made for composite material cut. Most of the many producers/ end users of composite material have standardized Rasor tools for their cutting process.

DESCRIPTION

Zero702 is the newly born model at Rasor. The first hand-held battery driven cutting tool for professional and stepless production process. It is made as combination of the cutting body of the already approved OPTIMA 702 and the innovative and modern battery driven motor. It weighs only 1900 grams (battery included) and develop a power of 400Watt which combined with a bronze/steel coupling gear develop an impressive cutting power. Zero702 is able to cut any kind of material at the "soft" stage up to a maximun thickness of 18mm. This is why this model is widely applied in textile, technical fabrics or composite material fields. The high torque allows to cut even rubber materials and plastic base materials in the fields of carpets or floorings. The speed of the knife is adjustable electronically from 600 RPM to 1000 RPM in order to be suitable to cut any kind of material. The foot is steel made, strong and miniaturd so to allow to trim straight or curved portions very easily and precisely. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The new rear fixed knife protection is now transparent plastic made to give more visibility during the cut operations. The battery of latest generation is lithium ions technology so to be able to develop 5 Ah. It has an extraordinary life and it is possible to see the charging rate through a LED lamp. Through the standard charger the battery can be re-charged in 55 minutes while through the fast charger (option) battery can be re-charged in 30 minutes only. All these features make ZERO702 the battery hand-held cutting tool more revolutionary and powerfull on the market able to satisfy any need in field of professional cutting tools.

DESCRIPTION

For over 30 years within the market, the model DS503 is the smallest, most powerfull and professional elctrical hand-held cutting machine Rasor have ever produced. The DS503 is the fifth upgrade in the DS series resulting in the 2014 model which reaches the highest level in technology and safety. It weighs only 950 grams and its ergonomic design combined with a 90Watt balanced and silenced motor make this model a unique cutting tool essential in all fields. A Reinforced body and bronze/steel gear coupling create a high torque which allows the use of this electrical shear not only in textile field but also in technical fabrics or leather fields. The maximun cutting thickness is now 9mm and the new push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The new circuit board includes a glass fuse which can be easily replaced without disassembling the shear and the new strong and slim shaped foot allows to trim curve sections very easily. The new model DS503 is truly a novel concentration of power and lightness in the field of professional cutting tools.

DESCRIPTION

DS503MT is the new electrical hand-held cutting machine designed for trimming the edges. The new slim shaped foot is welded with a widia counterblade to reduce the overall dimension of the shear. With DS503MT is therefore possible to trim straight or curved sections of material with high precision. DS503MT is well used for trimming textile and leather in furnishing field (chairs, sofa and armchairs) while especially used to cut away the extra-waste material on moulds for plastic and glass fiber. It weighs only 950 grams and its ergonomic design combined with a 55Watt balanced and silenced motor make this model a unique cutting tool very easy to be used. The maximun cutting thickness is 8mm and the new installed sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The new circuit board includes a glass fuse which can be easily replaced without disassembling the shear.

DESCRIPTION

This latest version in the OPTIMA series results a truly revolutionary hand-held cutting machine. Already over 1000 units sold of previous version the new 2014 model grant a highest level in technology ever reached before for a cutting tool of such a small size. Within small size and weight this model OPTIMA 702 reaches a power of 150 Watt which combined with a bonze and high resistance steel gear coupling allows an impressive cutting torque. OPTIMA 702 is able to cut any kind of soft material up to 18mm thickness. It is for this reason which is widely applied in textile, technical fabrics and composite material. The high torque and the slow speed of the knife allow to cut also rubber or plastic base material in the field of carpets and flooring. The steel foot being strong and of small dimension allows a very precise and easy cut of straight or curve sections. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The new circuit board includes a glass fuse which can be easily replaced without disassembling the shear and the new rare fixed protection is in transparent plastic to give better visibility during cutting operation. OPTIMA 702 is the cutting tool most revolutionary and powerfull on the market able to satisfy any kind of cutting professional demand.

DESCRIPTION

The newest model in FP series, FP503 is the lighter and most powerfull pneumatic hand-held cutting tool Rasor have ever produced in more than 70 years of work. The air motor is wholly made by Rasor. Thanks to latest generation pneumatic and mechanical components, the turbine reaches an extraordinary power of 350Watt in 22,000 RPM and a very high torque. The motor diameter is only 40mm that is the smallest within its cathegory. The rotor bldes are designed and produced in VANESTAR material so to reduce to minimun the weight and the friction. The cutting part has also been wholly reassessed : a reinforced structure and bronze/steel gear coupling create a high torque which allows the use of this pneumatic cutting tool not only in textile field but also in technical fabrics or leather fields. The max cutting thickness is now 9mm and the new push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The new stong and slim shaped foot allows to trim curved sections very easily. The new model FP503 is truly a novel concentration of power and lightness (it weights only 800 grams) in the field of professional cutting tool.

DESCRIPTION

The new hand held cutting tool model FP503MT has been designed for the trimming edges cutting. The new foot has a slim shape with a welded carbide counterblade, that is to reduce the overall dimensions. This cutting tool is thus applied to trim with very high precision material having straight or curved edges. It is mainly used for trimming textile and leather within the furniture field and it is especially suitable for trimming away the over material in the molds for carbon fiber and glass fiber. The air compressed motor is wholly made by Rasor. Thanks to the latest generation mechanical and pneumatic components, the excellent turbine reaches a power of 350W at 22,000 RPM and a high torque. The motor diameter is now of only 40mm that is the smallest within its category. The rotor blades are made of VANESTAR material which reduce to the minimum the weight and the friction. The maximum cutting thickness is of 9mm and the sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. It is truly a novel concentration of power and lightness (it weighs only 780 grams) in the field of professional cutting tools.

DESCRIPTION

The model FP70 is the best compromise between weight and powerfull in the field of professional pneumatic hand-held cutting tools. The air motor is wholly made by Rasor. Thanks to latest generation pneumatic and mechanical components, the turbine reaches an extraordinary power of 380Watt in 22,000 RPM and a very high torque. The motor diameter is now only 40mm that is the smallest within its category. The rotor blades are designed and produced in VANESTAR material so to reduce to minimum the weight and the friction. The model FP70 weights only 920 grams and it is able to cut any kind of material at the "flexible stage" up to maximum cutting thickness of 18mm. This is the reason why this model is normally applied in textile, technical fabric and composite material field. The high torque and the low speed of the knife allow to cut even rubber material with plastic base within the carpet and flooring application. The foot is steel made, strong and of small dimension so to allow cutting straight or curved sections easily and precisely. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The new fixed rear protection is now transparent plastic made to have more visibility during the cutting operations. Model FP70 is the best solution able to satisfy any need in the field of professional cutting tool.

DESCRIPTION

New model FP861 is the most powerfull pneumatic hand held cutting machine ever produced by Rasor. Air compressed motor is wholly made by Rasor. thanks to the latest generation mechanical and pneumatic components, this excellent turbine reaches a power of 400W with 20.000 RPM and a very high torque. The diameter of motor is now of 40mm only, the smallest within its cathegory. The rotor blade are made of VANESTAR material which reduce to the minimun the weight and the friction. The model FP861 with a knife of 86mm diameter and 8-edges is able to cut any kind of material at the "flexible stage" up to maximun cutting thickness of 25mm. This is the reason why this model is normally used in textile, technical fabric and composite material field. Due to high powerfull it is able to cut several layers of fiber glass and carbon fiber. The high torque and the low speed of the knife allow to cut even rubber material with plastic base within the carpet and flooring application. The foot is aluminium made, light and small dimension so to allow cutting straight or curved sections easily and precisely. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The new fixed rear protection is now transparent plastic made to have more visibility during the cutting operations.

DESCRIPTION

The pneumatic hand-held model FP861RC is definitely the most innovative and clever cutting tool. It allows the cut of material from the top (etching operation) by a 5-edges knife that comes out from the structure of the machine through the only pressure of the user. The model FP861RC is suitable mainly for cutting material in rolls shape like paper, fabric or recycle material. Beside, it can be used to cut flooring to be removed or disposed. The cutting operation of FP861RC is not through removing material but etching the material. A selector allows to adjust the outcoming knife in three positions: cutting thickness of 3mm, 10mm or 20mm. This model FP861RC is suitable to shear the paper rolls whenever it is necessary to cut in depth (20mm) and smaller cut (10mm or 3mm) to save the inside core (i.e. the carton roll). Model FP861RC replaces the use of standard blades and knives while increase the speed and quality of cut and the safety of the operators. Air compressed motor is wholly made by Rasor. thanks to the latest generation mechanical and pneumatic components, this excellent turbine reaches a power of 400W with 20,000 RPM and a very high torque. The diameter of motor is now of 40mm only, the smallest within its category. The rotor blade are made of VANESTAR material which reduce to the minimum the weight and the friction. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The installed knife is 86mm diameter and teflon coated in order to go smoothly through the material and to reduce the friction between the knife and cutting material.

DESCRIPTION

D86 is the smallest model of bench cutting machine operating with a round knife. Model D86 is a powerfull and easy-handling cutting machine which weighs less than 3 kilos. It founds large application in textile field and especially suitable to cut natural fiber as cotton, wool or silk. The semiautomatic stone sharpening system which can be operated by a proper lever allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. Its aluminium base with rolls is Teflon® coated to be friction proof and to grant an easy feed with no efforts. The few maintenance and low operation cost make this model the best cutting machine for any application in textile field.

DESCRIPTION

For over 40 years within the market, the model D100 is the most efficient and popular bench cutting machine in textile application. It weighs less than 3 kilos and reached the highest level in technology and safety resulting a powerfull and easy-handling cutting machine. It finds Wide application in textile field. It is especially suitable to cut natural fiber as cotton, wool or silk. The semiatuomatic sharpening stone system to be operated by a proper lever allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The aluminium base with rolls is Teflon® coated to be friction proof and to grant an easy feed with no efforts.

The low maintenance and low operation cost make surely this model the best cutting machine for any application in textile field.

DESCRIPTION

D86P2 is the smallest model in Rasor range of bench cutting machine with a widia counterblade. It is a powerfull and easy-handling cutting machine which weigh less than 3 kilos. The 5-edge knife assure a sharp and precise cut without rag grinding. The diameter of the knife being only 86 mm allows an ease curve trimming and thin sections. The semiautomatic stone sharpening system allows the sharpening of the knife edge to be done in only 10 seconds without removing the knife. The aluminium base with rolls is Teflon® coated to be friction proof and to grant an easy feed with no efforts. D86P2 is widely applied in textile, technical fabrics and in the leather and carpets industries. The few maintenance and low operation cost make D86P2 to be the best cutting solution for any of your application.

DESCRIPTION

For over 30 years within the market, SW100 is the most efficient and popular bench cutting machine in textile and technical fabrics fields. It reached the highest level of technology and safety and can grant power and easy handling due to its weigh of only 3 kilos. The combination between blade and counterblade make the cut to be sharp and precise without any rag grinding. The 90Watt balanced and silenced motor combined with high resistance bronze/steel gear couplings create a long lasting stability. The 6-edge 100mm diameter knife allows to cut any kind of fabric up to 35mm thickness. The aluminium cutter base with rolls is Teflon® coated to be friction proof and grant an easy feed of the fabric with no efforts. The push button sharpening stone allow the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The low maintenance and low operation cost make surely SW100 to be the best cutting machine suitable for any application in textile and technical fabrics fields.

DESCRIPTION

SW12 is the biggest Rasor bench cutting machine. For over 25 years within the market, the model SW12 reached the highest level in technology and safety and still can collect a big success in the high thickness cutting application. Its 120mm diameter knife allows the cut of fabrics upto 50mm thickness. The powerfull 180Watt motor combined with a strong bronze/steel coupling gears create high torque plus a high blade speed of 850RPM. SW12 is widely applied in textile or technical fabrics fields and it is especially suitable to cut high thickness material like mattress, foams and natural fibers in many layers. The new push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The aluminium cutting base with rolls is Teflon® coated to allow the easy feed of the machine and the reduction of the friction between the platform and the material. Model SW12 is definetly the best professional bench cutting machine for high thickness.

DESCRIPTION

SW12M is Rasor new generation bench cutting machine. Launched on the market only a couple of months ago SW12M gives its excellency to the new geometry of the motor housing of Monster series. The difference between SW12M and the other Rasor bench cutting machine is given by its motor housing held by a central foot fitted behind the blade in central position. This system spreads the shearing stress and the necessary stress to move the machine through the fabrics on both sides of the cutter and cut is so done perfectly straight and smooth. The knife is half-free on both sides to avoid winding problems even with tough fibers. SW12M is especially suitable to cut composite materials like glass fiber, carbon fiber, kevlar or any soft material up to 50mm thickness. The impressive 350Watt motor combined with a bronze/steel coupling gear create a very high torque which combined with the slow RPM of the knife allow to cut even rubber materials and plastic based material in the field of carpets and industrial flooring. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. SW12M...just over the limits.

DESCRIPTION

Model FP861V2 is a pneumatic cutting unit to cut textile and technical fabrics. The air compressed motor is wholly made by Rasor. Thanks to the latest generation mechanical and pneumatic components, the excellent turbine reaches a power of 400W at 20,000 RPM and a high torque. The motor diameter is now of 40mm only that is the smallest within its category. The rotor blades are made of VANESTAR® material which reduce to the minimum the weight and the friction. The installed knife of 86mm diameter 8-edges allow the cutting of any kind of material at the "flexible stage" up to a cutting thickness of 25mm. The high torque and the slow speed of the knife allow the cutting of rubber material with plastic base in the carpet and light flooring application. Especially suitable for transversal cutting the model FP861V2 is also suitable to be installed in small spaces thanks to the vertical position of the motor. This model is arranged with an anchor flange easy to be fitted on fixed or automatic stirrup. The base is Teflon® coated and allows the easy movement of the cutting tool reducing the friction between the base and the cutting material. It can be installed on sliding rails within a small space. The semi-automatic push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The small maintenance and small handling costs make the model FP861V2 the best solution for a powerful and reliable cutting within any O.E.M. application.

DESCRIPTION

Model FP120 is a pneumatic cutting unit for cutting textile and technical fabrics having high thickness even with multi-layer. This is the most powerful cutting unit that Rasor has ever produced. The air compressed motor is wholly made by Rasor. Thanks to the latest generation mechanical and pneumatic components, the excellent turbine reaches a power of 800W at 15,500 RPM and a very high torque. The installed knife of 120mm diameter 8-edges allow the cutting of any kind of material at the "flexible stage" up to a cutting thickness of 50mm. The high torque and the slow speed of the knife allow the cutting of rubber material with plastic base in the carpet and light flooring application. FP120 is perfect to cut rubber, composite and plastics material. Especially suitable for the transversal cut to be installed in small spaces and it is arranged with an anchor flange easy to be fitted on fixed or automatic stirrup. The Teflon® coated aluminium base reduce the friction and to allow the easy movement of the cutting tool which can also be installed on sliding rails within a small space. For the continuous trimming processes FP120 is also available in left side version (specular) as model FP120SX. FP120 simply equal to top power and top performance for your O.E.M. application.

DESCRIPTION

Model FP120DT is a pneumatic cutting unit for cutting textile, technical fabrics and composite material having high thickness even with multi-layer. Thanks to the double carbide counter-blade FP120DT is able to cut on both directions (through a double air inlet). This peculiarity allow to save a run and time during the cross-cut process. The air compressed motor is made of the latest generation mechanical and pneumatic components, the excellent turbine reaches a power of 645 W at 15,500 RPM and a very high torque. FP120DT has a 120mm 8-edges knife which allows to cut any kind of materiale at the "flexible stage" up to a cutting thickness of 50mm. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The high torque and the slow speed of the knife allow the cutting of rubber material with plastic base in the carpet and light flooring application. FP120DT is especially suitable for the transversal cut and to be installed in small spaces and it is arranged with an anchor flange easy to be fitted on fixed or automatic stirrup. The aluminium Teflon® coated base reduce the friction between the foot and the material and allow the easy forward movement even for an installation sliding rails. The power and bidirectional feature make FP120DT the best solution for the most difficult O.E.M. application.

DESCRIPTION

D86PS2 is the smallest single-phase cutting unit with a widia counterblade. For over 20 years within the market, it is installed on the most popular tenters models. D86PS2 weighs less than 3 Kilos within a limited overall dimensions. The 5-edge knife assure a sharp and precise cut without rag grinding. The semiautomatic stone sharpening system allows the sharpening of the knife edge to be done in only 10 seconds without removing the knife. This model is widely applied in textile field and in leather and light carpets industries. It is especially suitable for the transversal cut due to its anchor flange which allows an easy fitting on fixed or automatic stirrup. The mini nylon base of this cutting unit allows its installation on sliding rails within a short space. The few maintenance and low operation cost make D86PS2 to be the cheapest and most reliable cutting solution in any of your O.E.M. application.

DESCRIPTION

For over 30 years within the market, SW100S is the most efficient and popular single-phase cutting unit in textile and technical fabrics fields. It reaches the highest level of technology and safety and guarantee power and reliability in less than 3 Kg. weight. The combination between blade and countblade allows a sharp and precise cut without any rag grinding. The 90Watt balanced and silenced motor combined with a high resistance bronze/steel gear couplings create a long lasting stability. The 6-edge 100mm diameter knife allows to cut any fabric up to 35mm thickness. SW100S is especially suitable to the transversal cut because it is arranged with an anchor flange easy to be fitted on fixed or automatic stirrup. The base is Teflon® coated so to allow an easy feed by reducing the friction between the base and the fabric and It is possible to install this cutting unit on slinding rails within a minimun space. The push button sharpening stone system allows the sharpening of the knife edge in less than 10 sec. without removing the knife. For the continuouos trimming process SW100S is also available in left side version (specular) as model SW100SL. The few maintenance and low operation cost make model SW100S to be the cheappest and most reliable cutting solution in any of your O.E.M. application.

DESCRIPTION

SW12SM is a new generation cutting unit for high thickness. Launched on the market only a couple of months ago SW12SM gives its excellency to the new geometry of the motor housing of Monster series. The difference between SW12SM and the other Rasor's cutting units is given by its motor housing held by a central foot fitted behind the blade in central position. This system spreads the shearing stress and the necessary stress to move the machine through the fabrics on both sides of the cutter and cut is so done perfectly straight and smooth. The knife is half-free on both sides to avoid winding problems even with tough fibers. SW12SM is especially suitable to cut composite materials like glass fiber, carbon fiber and kevlar. The impressive 350 Watt motor combined with a bronze/steel coupling gear develop a very high torque. SW12SM is able to cut any material at the "soft" stage un tp maximun 50 mm of thickness. High torque combined with the slow RPM of the knife allow to cut even rubber materials and plastic based material in the field of carpets and industrial flooring in multi-layers. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The aluminium cutting base is Teflon® coated to allow the easy run of the machine and the reduction of the friction between the base and the material. SW12SM is especially suitable for the transversal cut and it arranged with an anchor flange to be easily adjusted on fixed or automated hanger. For 24-hours a day trimming SW12SM is also available in left version (specular) as model SW12SSM.

 Fixed trasparent back blade protection
 Double electric insulation

DESCRIPTION

SW12SSM is a new generation cutting unit for high thickness. Launched on the market only a couple of months ago SW12SSM gives its excellency to the new geometry of the motor housing of Monster series. The difference between SW12SSM and the other Rasor's cutting units is given by its motor housing held by a central foot fitted behind the blade in central position. This system spreads the shearing stress and the necessary stress to move the machine through the fabrics on both sides of the cutter and cut is so done perfectly straight and smooth. The knife is half-free on both sides to avoid winding problems even with tough fibers. SW12SSM is especially suitable to cut composite materials like glass fiber, carbon fiber and kevlar. The impressive 350 Watt motor combined with a bronze/steel coupling gear develop a very high torque. SW12SSM is able to cut any material at the "soft" stage un tp maximun 50 mm of thickness. High torque combined with the slow RPM of the knife allow to cut even rubber materials and plastic based material in the field of carpets and industrial flooring in multi-layers. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The aluminium cutting base is Teflon® coated to allow the easy run of the machine and the reduction of the friction between the base and the material. SW12SSM is especially suitable for the transversal cut and it arranged with an anchor flange to be easily adjusted on fixed or automated hanger. For 24-hours a day trimming SW12SSM is also available in right version (specular) as model SW12SM.

A close-up photograph of a light-colored, finely woven fabric, possibly a mesh or technical textile. The fabric has a consistent diamond-shaped weave pattern. A prominent diagonal crease or fold runs from the upper left towards the lower right, creating a sense of depth and texture. The lighting is soft, highlighting the individual threads and the overall texture of the material.

3-Phases cutting units

GRT-MINI

3-PHASES CUTTING UNITS

SPECIFICATIONS

Blade diameter: 86 mm (3.4"), with hard metal counterblade
Blade descr.: 86PHSS, 5-edges, HSS steel
Blade speed: 550 r.p.m.
Cutting ability: 25 mm (1")
Motor: 3-phases asynchronous 380/400* V, 50 Hz
Power: 55 W
Consumption: 0.3 A
Protection: IP20 – CL F
Net weight (with power supply cord): 2650 g
Total weight (with packaging): 4750 g
Electric cable length: 1.5 mt (with no plug)
Minimum brightness for working operations: 200 LUX
Vibrations at start up: < 2.5 m/sec²
Temperature range: 0 – 55 C
Umidity range: 10 – 95% without condensate

* This model can be set up at 3-phase 220 V
* On request: 480 V, 60 Hz

SAFETY

New sharpening device system
New Teflon® coated aluminium base
Heigh-adjustable trasparent fore blade protection
CLF - IP20 electric insulation

DESCRIPTION

Model GRT-MINI is the smallest three-phase cutting unit with carbide counter-blade. For many years within the market it is installed on the main tentering machines. GRT-MINI is powerfull, small and light (less than 3 Kg.). The 5-edges knife guarantee a clean cut without rag grinding. The semi-utomatic sharpening stone allows the sharpening of the knife edge to be done in less than 10 secons without removing the knife. GRT-MINI is widely applied in textile, leather, light carpet or technical fabrics field. The three-phase induction motor is balanced and noiseless. This cutting unit does not need any maintenance so to be easily used during the production process on 24 hours-a-day. It is especially suitable for the transversal cut and it arranged with an anchor flange to be easily adjusted on fixed or automated hanger. The new base is Teflon® coated aluminium made and miniaturized so that can be installed on sliding rails within a small space. The minimun maintenance and the minimun handling costs make GRT-MINI the cheap and reliable cutting solution for any O.E.M. application.

DESCRIPTION

GRT12DT is a three-phase cutting unit suitable to cut high thickness in the technical fabric and composite material fields. Thanks to the double carbide counter-blade GRT12DT is able to cut on both directions (through an inverter). This peculiarity allow to save one run and so time in cross-cut process. The three-phase induction motor is balanced and noiseless. It does not need any maintenance so to be easily used for 24 hours-a-day production process. This type of motor together with bronze/steel couplings give the cutting unit to be reliable and resistance in life. The 8-edges 120mm knife allows a cutting thickness up to 50 mm even for multiple layers. High torque combined with the slow RPM of the knife allow to cut even rubber materials and plastic based material in the field of carpets and industrial flooring. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The aluminium base is Teflon® coated to reduce friction with the material and can be installed on sliding rails within a small space. GRT12DT is especially suitable for the transversal cut and it arranged with an anchor flange to be easily adjusted on fixed or automated hanger. The powerfull and bi-directional cut make GRT12DT the perfect solution for the most complicate O.E.M application.

DESCRIPTION

Model DD120R is a three-phase cutting unit for cutting textile, technical fabrics and composite material. That is part of the latest technology of Rasor DirectDrive such as the knife installed on the same axis of the motor. DD120R has no coupling gear which means no maintenance (i.e. the lubrication with grease) reducing therefore also the operation cost while using during the no-stop 24h/day production processes. The knife can reach a speed of 2600 RPM so this tool comes perfect for the high speed no-stop cutting process. The cutting system by a knife and counterblade assure a precise and sharp cut without scraps. The induction three-phase motor is balanced and silenced with no maintenance needed assuring reliability for life. The knife is 120 mm diameter 8-edges and allows to reach a cutting thickness of 50 mm even as multi-layers. DD120R is especially studied for the transversal and no-stop cut and it is arranged with a anchor flange easy to be fitted on fixed or automatic stirrup. The aluminium Teflon® coated base reduce the friction between the foot and the material and allow the easy forward movement even for an installation sliding rails. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. For the no-stop trimming process DD120R is also available in left version (specular) as model DD120L. The minimum needed maintenance and low production cost make DD120R to be a reliable cutting solution in any high speed O.E.M. application.

DD120L

3-PHASES DIRECTDRIVE CUTTING UNITS

SPECIFICATIONS

Blade diameter: 120 mm (4.7"), with hard metal counterblade
Blade descr.: 12SHSS, 8-edges, HSS steel
Blade speed: 2600 r.p.m.
Cutting ability: 50 mm (2")
Motor: 3-phases asynchronous 380/400* V, 50 Hz
Power: 180 W
Consumption: 0.52 A
Protection: IP20 – CL F
Net weight (with power supply cord): 4000 g
Total weight (with packaging): 5700 g
Electric cable length: 1.5 mt (with no plug)
Minimum brightness for working operations: 200 LUX
Vibrations at start up: < 2.5 m/sec 2
Temperature range: 0 – 55 C
Umidity range: 10 – 95% without condensate

* This model is also available in right side version (specular) as model **DD120R**
 * This model can be set up at 3-phase 220 V
 * On request: 480 V, 60 Hz

SAFETY

Heigh-adjustable fore blade protection in anodized aluminium
 Heigh-adjustable back blade protection in anodized aluminium
 CLF - IP20 electric insulation

DESCRIPTION

Model DD120L is a three-phase cutting unit for cutting textile, technical fabrics and composite material. That is part of the latest technology of Rasor DirectDrive such as the knife installed on the same axis of the motor. DD120L has no coupling gear which means no maintenance (i.e. the lubrication with grease) reducing therefore also the operation cost while using during the no-stop 24h/day production processes. The knife can reach a speed of 2600 RPM so this tool comes perfect for the high speed no-stop cutting process. The cutting system by a knife and counterblade assure a precise and sharp cut without scraps. The induction three-phase motor is balanced and silenced with no maintenance needed assuring reliability for life. The knife is 120 mm diameter 8-edges and allows to reach a cutting thickness of 50 mm even as multi-layers. DD120L is especially studied for the transfersal and no-stop cut and it is arranged with a anchor flange easy to be fitted on fixed or automatic stirrup. The aluminium Teflon® coated base reduce the friction between the foot and the material and allow the easy forward movement even for an installation sliding rails. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. For the no-stop trimming process DD120L is also available in right version (specular) as model DD120R. The minimum needed maintenance and low production cost make DD120L to be a reliable cutting solution in any high speed O.E.M. application.

DESCRIPTION

Model DD120LC is a three-phase cutting unit for cutting textile, especially natural fiber, mattress or sponge, during production process. That is part of the latest technology of Rasor DirectDrive such as the knife installed on the same axis of the motor. DD120LC has no coupling gear which means no maintenance (i.e. the lubrication with grease) reducing therefore also the operation cost while using during the no-stop 24h/day production process. The knife can reach a speed of 2600 RPM so this tool comes perfect for the high speed no-stop cutting process. The induction three-phase motor is balanced and silenced with no maintenance needed assuring reliability for life. The knife is 120 mm diameter 8-edges and allows to reach a cutting thickness of 50 mm even as multi-layers. DD120LC is especially studied for the transversal and no-stop cut and it is arranged with a anchor flange easy to be fitted on fixed or automatic stirrup. The aluminium Teflon® coated base reduce the friction between the foot and the material and allow the easy forward movement even for an installation sliding rails. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. For the no-stop trimming process DD120LC is also available in right version (specular) as model DD120RC. The minimum needed maintenance and low production cost make DD120LC to be a reliable cutting solution in any high speed O.E.M. application.

DESCRIPTION

Model DD120DT is a three-phase cutting unit for textile, technical fabrics and composite material. Thanks to the double carbide counter-blade DD120DT is able to cut on both directions (through an inverter). This peculiarity allow to save one run and so time in cross-cut process. DD120DT is part of new technology of Rasor Direct Drive range which see the knife installed on the same axis of the motor. DD120DT has no coupling gear which means no maintenance (i.e. the lubrication with grease) reducing therefore the operation cost. The knife can reach a speed of 2600 RPM so this tool comes perfect to work at very high speed during no-stop 24h/day cutting process. The combination of knife and counterblade assure a precise and sharp cut without scraps. The induction three-phase motor is balanced and silenced requiring no maintenance while assuring reliability for life. The 8-edges 120 mm knife allows a cutting thickness up to 50 mm even for multiple layers. DD120DT is especially designed for the transversal and no-stop cut and it is arranged with a anchor flange easy to be fitted on fixed or automatic stirrup. The base of DD120DT is Teflon® coated to reduce friction with the material and can be installed on sliding rails within a small space. The push button sharpening stone allows the sharpening of the knife edge to be done in less than 10 seconds without removing the knife. The limited maintenance, the low production cost and the bi-directional function make DD120DT the best reliable solution for any high speed O.E.M. application.
